Cutting-Sewing-Finishing is the common terminology used for the overall process that takes place in any organisation manufacturing garments via the industrial way. The cutting room or cutting department is the place where all the pre-sewing activities like spreading, cutting, bundling, ticketing, fusing, and embroidery are conducted before the cut components are sent to the sewing department. In a garment factory, cutting department is pivotal from the point of view of controlling the material utilisation, considering the fact that material constitutes 60% of the manufacturing cost. Although the labour cost component in spreading and cutting is very less in comparison to sewing, the process involves material conversion which is irreversible, and hence, it is profoundly significant. Like any other department, the technology used and the processes being followed are the two most important parameters of cutting room. This multi-author book is an honest attempt on our part to cover all the cutting room processes in detail to unravel the relevance of material utilisation for garment manufacturing and thus provide an essential guide for cutting room managers and executives. These processes act as the tipping point for a garment factory where even a minor wastage or saving done in the fabric being used can have a major impact on the order margins. Besides, they lay the foundation for the garments' quality and hence become all the more important.

Proceedings from the latest meeting of the leading AI conference; includes theoretical, experimental, and empirical work. The National Conference on Artificial Intelligence remains the bellwether for research in artificial intelligence. Leading AI researchers and practitioners as well as scientists and engineers in related fields present theoretical, experimental, and empirical results, covering a broad range of topics that include principles of cognition, perception, and action; the design, application, and evaluation of AI algorithms and systems; architectures and frameworks for classes of AI systems; and analyses of tasks and domains in which intelligent systems perform. The Innovative Applications of Artificial Intelligence conference highlights successful applications of AI technology; explores issues, methods, and lessons learned in the development and deployment of AI applications; and promotes an interchange of ideas between basic and applied AI. This volume presents the proceedings of the latest conferences, held in July, 2004.
