Another common mechanism that is covered in the first weeks of organic chemistry is the free radical halogenation of alkanes. This mechanism utilizes the homolytic cleavage (one electron per atom) property of halogens when exposed to heat or ionizing radiation (i.e. hv), which is a popular mechanism for future reactions in the course.

Decarboxylation is a chemical reaction that removes a carboxyl group and releases carbon dioxide (CO 2).Usually, decarboxylation refers to a reaction of carboxylic acids, removing a carbon atom from a carbon chain.The reverse process, which is the first chemical step in photosynhesis, is called carboxylation, the addition of CO 2 to a compound. Enzymes that catalyze decarboxylations are called ...
