A completely revised and redesigned new edition of this popular introduction to the night sky. In his characteristically entertaining and informative style, Sir Patrick introduces the wonders of the night sky to absolute beginners. The Moon, the planets, the Sun and the stars are explained in non-technical language, and then the constellations are introduced, with the help of star maps and tables.The four main chapters in the Philip's Guide to the Night Sky are devoted to what's on view in each season of the year. The information is appropriate for observers in Britain and Ireland, northern Europe, northern United States and Canada; it will also be helpful a little outside these latitudes. Using prominent patterns, such as the Plough and Orion, Sir Patrick teaches the reader to 'star-hop' from constellation to constellation, thus learning to navigate the night sky. Star maps and photographs illustrate and clarify what will be on view.Philip's Guide to the Night Sky is an ideal introduction to stargazing, suitable for all ages and with no need for anything more technical than the naked eye.Main map scale:

Philip's Guide to Stars and Planets provides all the information you need to study the night sky with the naked eye, binoculars or a telescope. It includes a detailed Moon map and a complete atlas of the constellations, and is suitable for observers in both the northern and southern hemispheres. A straightforward and comprehensive handbook, it opens with chapters on the Moon, the Sun, the planets, the stars and galaxies, as well as information on astrophotography, telescopes and an explanation of the apparent movement of the night sky. The second section of the book comprises a full set of constellation maps, showing all stars visible to the naked eye as well as the brighter nebulae and galaxies. Each map is accompanied by a description of that particular constellation, pointing the observer to the most interesting stars and deep-sky objects in that area of the sky. Tables give the co-ordinates, magnitudes and distances of the brightest stars in each constellation. The book concludes with a comprehensive glossary, and timelines of astronomy and space exploration. Philip's Guide to Stars and Planets is a dependable, accurate and attractive reference source for all amateur astronomers.

The Solar System Almanac explains the movement of the planets, with particular attention paid to their positions in 2018. Solar and lunar eclipses, meteor showers and comets are also described. Exploring the Deep Sky - Using Binoculars - Stargazing recommendations from expert Robin Scagell. The observer can use the monthly charts to discover which constellations are on view, and then use this information to plan deep-sky observing. Expert Robin Scagell's Equipment Review looks at the pro's and con's of Stargazing with binoculars or telescope and offers advice for both.

Opposite each map is a 'photorealistic' image which shows how the same portion of the sky appears to the naked eye. The next group of maps show the most interesting parts of the sky at a much larger scale, in 40 full-colour constellation charts, accompanied by colour photographs and drawings and a detailed explanatory text.

In a new flexi-paperback format, Philip's Complete Guide to Stargazing is an inspiring introduction to astronomy, providing all the information you need to explore the night sky. This is a comprehensive guide to an increasingly popular leisure pursuit. Author Robin Scagell first introduces the wonders of the night sky and explains how and why the sky changes during the night and through the seasons. He describes the various items of equipment you can use (binoculars, telescopes and accessories), and gives practical advice on what to choose and what you can expect to see. There are plenty of tips, too, for observing just with the naked eye. The book continues with chapters devoted to the Moon, the Solar System, the stars and deep sky objects, illustrated with photographs and observational drawings made by talented amateur astronomers, as well as spectacular images returned by spacecraft or taken by large telescopes. The month-by-month guide to the constellations features maps showing the constellations on view each month from both northern and southern hemispheres, and is applicable to any year and any place on Earth. A complete set of star charts presents the whole sky in a series of maps that show stars down to magnitude 5.5. These maps are drawn with black stars on a white background, so that observers can pencil their own observations on to the charts. Opposite each map is a 'photo-realistic' image which shows how the same portion of the sky typically appears to the eye. Completing the book is an illustrated A-Z dictionary of astronomy, covering the planets, stars and galaxies, cosmology, amateur astronomy and professional observatories, space exploration, famous astronomers, scientific terms, theories and much more, and is illustrated with photographs, artworks and diagrams. Philip's Complete Guide to Stargazing is an invaluable reference source for astronomers of all levels.
