plastic material and is used where steam-sterilized medical devices are necessary. In addition to resistance to steam sterilization, mechanical performance properties of polypropylene include durability for the number of cycles it can be reused.

What Plastics are Used in Medical Devices?

Commodity plastics like polyvinyl chloride (PVC), polyethylene, polypropylene, and polystyrene make up over 70% of the share of plastics used in medical devices. Engineering thermoplastics are used in applications that require better

strength, stiffness, toughness, chemical resistance, and biocompatibility compared to commodity resins.

Plastics in Medical Devices
| ScienceDirect

Commonly used plastic resins for the production of medical devices include:
Polyethylene- the ultra-high molecular weight polyethylene is an ideal material to create prosthetics
Polypropylene- the polymer is used where autoclave sterilization and radiation stabilization processes are required.

Professional Properties

Medical plastics are regulated by numerous agencies across the globe.

In Europe, medical devices fall under the EU Council Directive (93/42/EEC), which provides guidance for their consumption. Restructuring of the European regulations for such devices is anticipated to emerge as one of the key factors affecting the regional market growth.
