Addiction Medicine is a concise and practical guide for students and practitioners of medicine and other health professions who come into contact with people with substance use disorders. It provides the knowledge base and the skill set required for good professional practice in this field. Substance use rates amongst the top four risk factors contributing to the global burden of disease. Substance use disorders can cause, mimic, underlie or complicate a large number of common medical and psychiatric disorders. Making a correct diagnosis of the substance use disorder can facilitate clinical diagnosis, avoid unnecessary tests, shorten hospital stay and make the clinician and patient's life easier and safer. Increasingly, the ability to diagnose and initiate management of substance use disorders is the responsibility of all medical and health professionals. This invaluable guide discusses the broad range of management options and the evidence base behind modern addiction medicine. The first chapter outlines important background information and summarises the principles of addiction medicine. It encompasses the epidemiology of psychoactive substance use, the pharmacology and neurobiology of the major substances, and the natural history of the main clinical disorders. Two chapters summarise the principles of assessment and diagnosis and management which inform the practice of addiction medicine. Background and management focused on specific types of psychoactive substances are then covered in detail. The remainder of the book is devoted to the management of substance use disorders experienced by specific groups and in specific circumstances and places, within the broad professional and legal context. A series of appendices provides summaries of concepts and practical tools to aid management.

Among Australians use of alcohol and other drugs is almost ubiquitous and results in 13% of total morbidity, but clinicians generally receive limited training in diagnosis and management of substance-use disorders. Written by clinical and academic specialists in their fields, and providing a comprehensive overview of the principles and practice of addiction medicine, this textbook will facilitate such training. The book's 36 chapters, by 62 specialist contributors, are organised into 5 sections. In Section 1, how substance use can be understood and core principles of management of substance-use disorders are outlined. In Section 2, the clinical and other core skills required for practice are described: clinical assessment, therapeutic relationship, psychological interventions, screening and brief interventions, drug testing and biomarkers of consumption, responsible prescribing, and medico-legal assessment and report-writing. In Section 3, common clinical issues – intoxication and overdose, withdrawal, comorbidities, and pain management and pharmaceutical opioids – are described. Section 4, the largest section, is devoted to consideration of specific substances, legal, illegal, and emerging: tobacco, alcohol, opioids, cannabis, stimulants, hallucinogens, benzodiazepines, and volatile substances. The focus of Section 5 is special populations, adolescents, Aboriginal and Torres Strait Islanders, injecting-drug users, and others. With new clinical syndromes arising from synthesis of new substances, and with new approaches to treatment being developed, addiction medicine is a rapidly-evolving field. The book is designed to meet the specific needs of a young graduate who is starting a clinical rotation in a drug and alcohol unit. Medical students and junior medical officers will find the book valuable, as will other health professionals who care for people with substance-use problems in drug and alcohol services, nurses, counsellors, and welfare/social
