The experiment consisted of two different phases, a programming phase linked to the instruction in Scratch and focused on the acquisition of basic concepts of computational thinking (sequences, iterations, conditionals, and events-handling), and a mathematical phase completely oriented towards the resolution of mathematical tasks. In particular, the mathematical phase focused on word problems whose resolution involves the use of the least common multiple and the greatest common divisor.

In many ways discrete mathematics is more relevant to programming than numerical mathematics is: not just to particular kinds of programming, but to all programming. Many experienced programmers approach the design of a program by describing its input, output, and internal data objects in the vocabulary of discrete mathematics: sets, sequences, mappings, relations, and so on.

Mathematical thinking is crucial in all areas of computer science: algorithms, bioinformatics, computer graphics, data science, machine learning, etc. In this course, we will learn the most important tools used in discrete mathematics: induction, recursion, logic, invariants, examples, optimality. We will use these tools to answer typical programming questions like: How can we be certain a solution exists?

Computer programming helps to develop investigation skills as it requires the use of a previously unknown language to execute commands, which also develops the skills of mathematical thinking (ta). Computer programming also involves the use of modelling and planning techniques. Because Scratch is an open source programming language, this also creates opportunities for homework, as the children are able to download the software for themselves at home. Programming requires a way of thinking that isn 't directly analogous to mathematics. The ability to visualize data structures, decompose big problems into smaller problems, and think in terms of objects and functional abstractions. This doesn 't naturally follow from mathematical thinking.
