Punjab government will provide water connections and toilets to every rural household in the next six years, with the World Bank sanctioning a loan of Rs 1,540 crore for water and sanitation...

Rural drinking water quality is an emergent issue in the State of Punjab. In response to health concerns related to children being exposed to metals in some regions, and reports of higher incidence of cancers in the state, the department of drinking water supply and sanitation conducted blanket testing of all its water supply sources. The objective of this study was to systematically examine the drinking water quality issue and provide practical guidance to the state on possible responses. The state's commitment to addressing this issue is highlighted by its allocation of 59 million dollars for a component to improve water quality through the Punjab Rural Water and Sanitation Sector Improvement Project, financed by the World Bank. While the study seeks to provide an analytical basis for understanding the occurrence and impact of the contamination, practical actions have been explored and demonstrated to allow the state to begin actively managing the water quality issue. The study is designed around three key areas: understanding the problem; taking appropriate action; and institutional sensitization and action. This report is a first step toward understanding and managing water quality issues in the state. It provides an analytical basis for moving forward and has demonstrated approaches that have yielded valuable lessons for scale-up. The next steps are for the state to identify key actions and develop detailed action plans for implementation.

This synthesis report details the process, outputs, intermediate outcomes, lessons learned, and recommendations of the World Bank executed technical assistance (TA) on strengthening local providers for improved rural water supply in Pakistan implemented by the water and sanitation program of the global water practice. The development objective of this TA was to support the Government of Punjab (GoPunjab) in strengthening service provision by communities to ensure improved access to rural water supply, particularly for the marginalized and poor. These objectives were targeted through capacity building and introducing systems to better respond to community needs to manage rural water schemes via community based organizations (CBOs). This TA was primarily focused on the province of Punjab having a population of 100 million with of which 60 percent population live in rural areas. From inception, this TA was focused on institutional strengthening and sustainability. The back-up support mechanism for CBOs and information and communication technology (ICT) monitoring of scheme performance are extremely significant initiatives to have been integrated into the government system.

The supply of reliable and safe water is a key challenge for developing countries, particularly India. Community management has long been the declared model for rural water supply and is recognised to be critical for its implementation and success. Based on 20 detailed successful case studies from across India, this book outlines future rural water supply approaches for all lower-income countries as they start to follow India on the economic growth (and subsequent service levels) transition. The case studies cover state-level wealth varying from US\$2,600 to US\$10,000 GDP per person and a mix of gravity flow, single village and multi-village groundwater and surface water schemes. The research reported covers 17 states and surveys of 2,400 households. Together, they provide a spread of cases directly relevant to policy-makers in lower-income economies planning to upgrade the quality and sustainability of rural water supply to meet the Sustainable Development Goals, particularly in the context of economic growth.

This publication presents comprehensive statistics on aid flows in support of water supply and sanitation for the years 2001-2006, including trends in donors' aid and the degree of targeting of countries most in need.

The focus on results in development agencies has led to increased focus on impact evaluation to demonstrate the effectiveness of development programmes. This book illustrates the broad range of methods available for counterfactual analysis of infrastructure programmes such as establishment, rehabilitation and maintenance of roads, water supply and electrical power plants and grids. Understanding the impact of interventions requires understanding of the context in which the intervention takes place and the channels through which it is expected to occur. For infrastructure interventions it is particularly important to identify the links between the input and the outcomes and impacts because the well-being of people, the ultimate impact, does not change directly as a consequence of the intervention. Therefore impact evaluation of infrastructure programmes typically requires mixing both quantitative and qualitative approaches as illustrated in many of the contribution to this edited volume. This book was originally published as a special issue of the Journal of Development Effectiveness.

Separate Core and Foundation Books ensure that ALL pupils' needs are supported at exactly the right level. Identical pagination and coverage of the same topics makes them easy to use. Clear objectives for each unit helps pupils understand the purpose of their work. A self-assessment checklist at the end for pupils to check and follow-up their understanding and the 360 review page at the end of each chapter provides a ready-made assessment for teachers and a useful review for pupils. A skills reference section can be used as a quick reminder and practice for skills such as drawing pictograms, bar charts and using atlases. Key words are highlighted and explained when first introduced in a unit to aid comprehension. Popular topics such as Earthquakes and Volcanoes are included in Book 3 to help maintain pupils' interest in Geography and encourage them to continue with the subject at GCSE level.
