Robert C. Martin calls a list of code smells a "value system" for software craftsmanship. [7] Often the deeper problem hinted at by a code smell can be uncovered when the code is subjected to a short feedback cycle , where it is refactored in small, controlled steps, and the resulting design is examined to see if there are any further code ...

In computer programming and software design, code refactoring is the process of restructuring existing computer code—changing the factoring—without changing its external behavior. Refactoring is intended to improve the design, structure, and/or implementation of the software, while preserving its functionality. Potential advantages of refactoring may include improved code readability and reduced complexity; these can improve the source code's maintainability and create a simpler, cleaner ...
