Runge-Kutta Method : Runge-Kutta method here after called as RK method is the generalization of the concept used in Modified Euler's method. In Modified Eulers method the slope of the solution curve has been approximated with the slopes of the curve at the end points of the each sub interval in computing the solution.

$y(h) = y(0) + (1/6k_1 + 1/3k_2 + 1/3k_3 + 1/6k_4)h = y(0) + m h$.

The value of this final estimate for the given example is $y^*(h)=2.0112$. This is quite close to the exact solution $y(h)=3e^{-2}(0.2)=2.0110$. Note: As stated previously, we generally won't know the exact solution as we do in this case.

Runge-Kutta method

What is the Runge-Kutta 4th order method? Runge-Kutta 4th order method is a numerical technique to solve ordinary differential equation of the form $\frac{dy}{dx} = f(x, y)$, $y(0) = y_0$. So only first order ordinary differential equations can be solved by using Runge-Kutta 4th order method. In other sections, we have discussed how Euler and Runge-Kutta methods are used to solve higher order ordinary differential equations or coupled (simultaneous) differential equations.

3.3: The Runge-Kutta Method - Mathematics LibreTexts

Runge-Kutta methods provide higher-order accuracy with respect to the time step when compared to Euler's method, and a less stringent stability condition. Occasionally, it is preferable to increase the stability radius by sacrificing some accuracy. This is known as strong stability preservation (SSP), which is achieved by ensuring that a given norm of the solution is bounded.
