The sed command is a stream editor that works on streams of characters. It's a more powerful tool than grep as it offers more options for text processing purposes, including the substitute command, which sed is most commonly known for. 5.1.

sed & awk describes two text processing programs that are mainstays of the UNIX programmer's toolbox. sed is a "stream editor" for editing streams of text that might be too large to edit as a single file, or that might be generated on the fly as part of a larger data processing step.

bioinformatician's toolbox. Both awk and sed rely heavily on regular expressions to describe patterns in text upon which some operation should be performed. You can think of regular expressions as providing a succinct language for performing very advanced "find" and "find-and-replace" operations in a text file.

First appearing in Version 7 Unix, sed is one of the early Unix commands built for command line processing of data files. It evolved as the natural successor to the popular grep command. The original motivation was an analogue of grep (g/re/p) for substitution, hence "g/re/s".

Sed Sed is a non-interactive  
stream editor. It receives  
text input, whether from  
stdin or from a file,  
performs certain operations  
on specified lines of the
