Selection of current transformers and wire sizing in substations Abstract: While retrofitting protections and meters in substations, the older equipment get replaced with newer ones with the rest of the installation such as current transformer (CT) and lead remaining undisturbed.

Selection of current transformers and wire sizing in ...

Main criteria for current transformer selection. Transformer operated CT/VT meters are measuring on the primary side of distribution transformers. These CTs need to be isolated versus the medium voltage on the primary side. CT operated meter s are connected to the secondary side of the distribution transformer.

SELECTION OF CURRENT TRANSFORMERS & WIRE SIZING IN SUBSTATIONS Sethuraman Ganesan ABB Inc. Allentown, PA ABSTRACT More and more sub-stations are retrofitted with numerical relays, meters and monitoring devices. Most often, the older relay gets replaced with a newer relay with the rest of the installation such as Current Transformer (CT) and lead

SELECTION OF CURRENT TRANSFORMERS & WIRE SIZING IN SUBSTATIONS

While retrofitting protections and meters in substations, the older equipment get replaced with newer ones with the rest of the installation such as current transformer (CT) and lead remaining undisturbed. Utilities have standardized on their older current transformers and want to maintain the same current transformer specifications throughout their system even in their newer installation.

We use three types of current transformers that come in all sizes. Split Core CT: A split core CT breaks in half and reattaches. This allows installation within existing, live environments without changing or unplugging wiring. Because there is a break in the coil inside the transformer, they're not considered as accurate as a solid core CT.

Selection Of Current Transformers Wire Sizing In Substations

The "Current Transformer Wire Length Chart" below lists the maximum total lead wire length (Rlead1 + Rlead2) by VA rating for a CT with a 5A secondary. If the distance from the meter is 10 feet, then the total wire length for the chart is 20 feet. Values listed are based on stranded wire, 0.02Ω meter resistance and 50°C temperature.

Core selection. Core area for standard core (steel laminations) is equal to the square root of the power. Thus for a 360VA transformer you need a "tongue" core area of 19 sq.cm (at least), with permeability of about 500. With the core you have, you can have a maximum power of 290VA (losses included). In a well designed transformer, the core window will be almost completely.
