### Slotted Waveguide Antenna

Antenna Tutorial (Home) Slotted antenna arrays used with waveguides are a popular antenna in navigation, radar and other high-frequency systems. They are simple to fabricate, have low-loss (high antenna efficiency) and radiate linear polarization with low cross-polarization . These antennas are often used in aircraft applications because they can be made to conform to the surface on which they are mounted.

Antennas: The Slotted Waveguide Antenna  
Slotted Waveguide Array Antenna. Slotted antennas, a complement to dipole antennas, have slots a  $\lambda / 2$  long and a fraction of a wavelength wide. The antenna propagates based on Babinet's principle of a resonant radiator. The key difference between a dipole and a slotted antenna is the field components are interchanged in orientation.

The waveguide itself acts as a transmission line, and the slots in the waveguide can be viewed as parallel (shunt) admittances. The end of the waveguide is short circuited, so a rough circuit model of Figure 1 is: Figure 2. Circuit model of slotted waveguide antenna. The last slot is a distance  $d$  from the end (which is short-circuited, as seen in Figure 2), and the slot elements are spaced a distance  $L$  from each other.

A slotted antenna is used as an antenna in microwave radar systems. These types of antennas have a metal surface resembling a flat plate with slots. These slots are in the form of circular or rectangular holes. The size of the slot, its shape, and the driving frequency will influence the radiation pattern of the antenna.

In slotted waveguide antenna multiple slots are present in a waveguide forming a group of antennas. The separation between each slot is such that there exists half guide wavelength distance between center of each adjacent slot. These slots are cut on the two sides of the waveguide which is separated by the central line.
