Measure And Integral

Definition 1 Let $(A_n)_{n \in \mathbb{N}}$ be a sequence of subsets of a set X . (a) We say that (A_n) is increasing if $A_n \subseteq A_{n+1}$ for all $n \in \mathbb{N}$, and decreasing if $A_n \supseteq A_{n+1}$ for all $n \in \mathbb{N}$. (b) For an increasing sequence (A_n) , we define $\lim_{n \rightarrow \infty} A_n := \bigcup_{n=1}^{\infty} A_n$. For a decreasing sequence (A_n) , we define $\lim_{n \rightarrow \infty} A_n := \bigcap_{n=1}^{\infty} A_n$.

Let G be an open set in \mathbb{R} . Then $G \times \mathbb{R}$ is open in \mathbb{R}^2 . Thus $f^{-1}(G \times \mathbb{R}) = \{x \in \mathbb{R}^n : f(x) \in G\}$ and $g(x) \in \mathbb{R} \Rightarrow g^{-1}(G) = f^{-1}(G)$ is measurable. Hence f is measurable. Similarly, we can show g is measurable. (=) Assume both f and g are measurable in \mathbb{R}^n . Let G be an open set in \mathbb{R}^2 . By definition of product
