Bayesian Decision Theory is a fundamental statistical approach to the problem of pattern classification. It is considered as the ideal pattern classifier and often used as the benchmark for other algorithms because its decision rule automatically minimizes its loss function.

(PDF) Decision Theory and Bayesian Analysis

Bayesian decision theory refers to a decision theory which is informed by Bayesian probability. It is a statistical system that tries to quantify the tradeoff between various decisions, making use of probabilities and costs. An agent operating under such a decision theory uses the concepts of Bayesian statistics to estimate the expected value of its actions, and update its expectations based on new information.

BAYESIAN INFERENCE IN STATISTICAL ANALYSIS

Decision theory approach A decision-theoretic justification of the use of Bayesian inference (and hence of Bayesian probabilities) was given by Abraham Wald, who proved that every admissible statistical procedure is either a Bayesian procedure or a limit of Bayesian procedures. Conversely, every Bayesian procedure is admissible.

Decision theory is closely related to the field of game theory and is an interdisciplinary topic, studied by economists, statisticians, data scientists, psychologists, biologists, political and other social scientists, philosophers and computer scientists. Empirical applications of this rich theory are usually done with the help of statistical and econometric methods.
