Subtracting Integers is not too far off from adding integers. One good strategy for subtracting integers is to rewrite your expression into an addition problem. For example: $-1-6$ can become $-1+(-6)=-7$ When I am looking at problems with integers having opposite signs (one positive, one negative) I can also rewrite the expression but then I find the difference of the two numbers.

SUBTRACTING A NEGATIVE IS ALWAYS THE SAME AS ADDING A POSITIVE. A subtraction sum is always easier to do when we turn it into an addition sum. This is what we always do with subtraction questions that involve integers. WE ALWAYS CHANGE SUBTRACTION INTO ADDING THE OPPOSITE. This is called the "Adding the Opposite Method". Adding the Opposite Method

If you're calculating the sum of two negative integers, it looks like this: $(-7) + (-2) = -9$. To get the sum of a negative and a positive number, use the sign of the larger number and subtract. For example: $(-7) + 4 = -3$. $6 + (-9) = -3$. $(-3) + 7 = 4$. $5 + (-3) = 2$. The sign will be that of the larger number.

In this chapter you will work with whole numbers smaller than 0. These numbers are called negative numbers. The whole numbers larger than 0, 0 itself and the negative whole numbers together are called the integers.Mathematicians have agreed that negative numbers should have certain properties that would make them useful for various purposes.

Rules for Subtracting Integers. Keep the sign of the first number. Change the subtraction operations to addition operations. Change the sign of the numbers that follow to the opposite, i.e., positive becomes negative, and negative becomes positive. Then follow the rules for addition problems. $(-) - (-) = (-) - (+) = (+) - (-) =$

Subtract an integer by adding its opposite. Adding and Subtracting Integers Example 1: Solve. $\{ (- \ 2) \ - \ (- \ 6) \}$ Solution: Keep the first number, and convert the sign of the second number to it's opposite. (change subtraction into addition. Then: $\{ (- \ 2) \ + \ 6 \}$ Example 2: Solve. $\{ 8 \ + \ (12 \ - \ 20) \}$ Solution:

Adding and Subtracting Integers Examples. Example 1: Evaluate the following: $(-5) + 9 - (-1) - (-2)$ Solution: $(-5) + 9 = 4$ [Subtract and put the sign of greater number] $(-1) - (-2) ? (-1) + (-2)$ [Transform subtraction problems into addition problems] $? (-1) + (2)$ [Subtract and put the sign of greater number] Hence, $(-1) - (-2) = 1$

Defining Subtraction. Subtraction means "add the opposite.". That is, if a and b are any integers, then, $a \div b = a + (? b)$. Thus, for example, $?123?150 = ?123+ (?150)$ and $?57? (?91) = ?57+91$. In each case, subtraction means "add the opposite.". In the first case, subtracting 150 is the same as adding ?150.
