Three phase traffic theory developed by Russian physicist Boris Kerner explains the congestion by the phase transition in traffic system. In the three phases traffic theory, the three phases in traffic are consist of free flow and two congestion phases: synchronized flow and wide moving jam.

Switching circuit theory is the mathematical study of

the properties of networks of idealized switches. Such networks may be strictly combinational logic, in which their output state is only a function of the present state of their inputs; or may also contain sequential elements, where the present state depends on the present state and past states; in that sense, sequential circuits are said ...

Transmission and switching of calls is performed using the principle of time-division multiplexing (TDM). TDM allows multiple calls to be transmitted along the same physical path, reducing the cost of infrastructure. In call centers. A good example of the use of teletraffic theory in practice is in the design and management of a call center. Call centers use teletraffic theory to increase the efficiency of their services and overall
