Structure of Stars. The structure of a typical star was worked out by astrophysicists after 1920, largely based on observations of the Sun. The photosphere is the visible surface of a star and is the layer to which the surface temperature and radius apply. Constantly changing features appear there. These include sunspots; bright, grainlike patches called granulations; and dark, threadlike filaments of exploding gases that appear as prominences when seen at the edge of the star.
