Before HPLC was available, LC analysis was carried by gravitational flow of the eluent (the solvent used for LC analysis) thus required several hours for the analysis to be completed. Even the improvements added in later time were able to shorten the analysis time slightly.

HPLC is an abbreviation for high-performance liquid chromatography. Chromatography refers to the measurement method, chromatogram refers to the measurement results, and chromatograph refers to the instrument. Chromatography separates components in a particular substance and performs qualitative and quantitative analyses on those components.

~~Introduction to HPLC | JASCO~~

HPLC is an analytical technique used to separate, identify or quantify each component in a mixture. HPLC works following the basic principle of thin layer chromatography or column chromatography, where it has a stationary phase and a mobile phase. The mobile phase flows through the stationary phase and carries the components of the mixture with it.

High performance liquid chromatography (HPLC) is basically a highly improved form of column liquid chromatography. Instead of a solvent being allowed to drip through a column under gravity, it is forced through under high pressures of up to 400 atmospheres. That makes it much faster.

~~Introduction and HPLC~~

High-performance liquid chromatography (HPLC), formerly referred to as high-pressure liquid chromatography, is a technique in analytical chemistry used to separate, identify, and quantify each component in a mixture. It relies on pumps to pass a pressurized liquid solvent containing the sample mixture through a column filled with a solid adsorbent material.

Introduction Liquid chromatography is a separation method in which a mixture of components is resolved into its constituent parts by passage through a chromatographic column. It is carried out by passing the mobile phase, containing the mixture of the components, through the stationary phase, which consists of a column packed with solid particles.

~~Introduction and Theory of Chromatography~~

The inventors of modern chromatography, Martin and Synge, were aware as far back as 1941 that, in theory, the stationary phase requires very small particles and hence a high pressure is essential for forcing the mobile phase through the column. As a result, HPLC is also sometimes referred to as high-pressure liquid chromatography.
