Group theory in mathematics refers to the study of a set of different elements present in a group. A group is said to be a collection of several elements or objects which are consolidated together for performing some operation on them. In the set theory, you have been familiar with the topic of sets. If any two of the elements of a set are combined through an operation for producing a third element that belongs to the same set and that meets the four hypotheses that are the closure, the ...

(a) Theory and techniques in discrete mathematics are well-coupled with applications and implementations. For example, coding theory goes hand in hand with data compression, protocols and communication security. Graph theory is directly involved in algorithmic design and analysis, performance analysis of communication networks, etc.

Probability is the branch of mathematics concerning numerical descriptions of how likely an event is to occur, or how likely it is that a proposition is true. The probability of an event is a number between 0 and 1, where, roughly speaking, 0 indicates impossibility of the event and 1 indicates certainty.
