It was used in very early speaker systems, but it was basically a 'trial-and-error' design until the loudspeaker parameters were properly quantified by Neville Thiele and Richard Small. This allowed mathematical calculation of the enclosure and port sizes, and it was then possible to design a system, build it, and have it perform as expected.

A loudspeaker enclosure or loudspeaker cabinet is an enclosure (often box-shaped) in which speaker drivers (e.g., loudspeakers and tweeters) and associated electronic hardware, such as crossover circuits and, in some cases, power amplifiers, are mounted. Enclosures may range in design from simple, homemade DIY rectangular particleboard boxes to very complex, expensive computer-designed hi-fi ...

As the name suggests, the sealed enclosure system attaches the loudspeaker to a sealed enclosure (except for a small air leak included to equalize the ambient pressure inside). Ideally, the enclosure would act as an acoustical compliance element, as the air inside the enclosure is compressed and rarified.
