Threat modeling is a practice that shifts security as far to the left as possible. Threat modeling can occur as early as the planning stages within the software development life cycle (SDLC). Threat modeling lends itself to staying proactive instead of waiting until an incident occurs to react.

**Designing for Security With Threat Modeling**

Threat modeling is a type of risk analysis used to identify security defects in the design phase of an information system. Threat modeling is most often applied to software applications, but it can be used for operating systems and devices with equal effectiveness. Threat modeling is typically attack-centric; threat modeling most often is used to identify vulnerabilities that can be exploited by an attacker in software applications.
