Olympic Dam* is the world's largest deposit of uranium, and accounts for the major part of Australia's uranium resources, though it is only recovered as a by-product with copper. Both it and Carrapateena occur in a hematite-rich granite breccia complex in the Gawler Craton, overlain by approximately 300 metres of flat-lying sedimentary rocks of the Stuart Shelf geological province.

Geology of Uranium Deposits - World Nuclear Association

Uranium is a widely distributed metal with large low-grade deposits that are not currently considered profitable. As of 2015 646,900 tonnes of reserves are recoverable at US\$40 per kilogram of uranium, while 7,641,600 tonnes of reserves are recoverable at \$260 per kilogram.

List of countries by uranium reserves - Wikipedia

The highest grade uranium deposits are found in the Athabasca Basin in Canada, including the two largest high grade uranium deposits in the world, Cigar Lake with 217 million pounds (99,000 t) U₃O₈ at an average grade of 18% and McArthur River with 324 million pounds (147,000 t) U₃O₈ at an average grade of 17%. These deposits occur below, across and immediately above the unconformity.
